PREDICTION PAGE

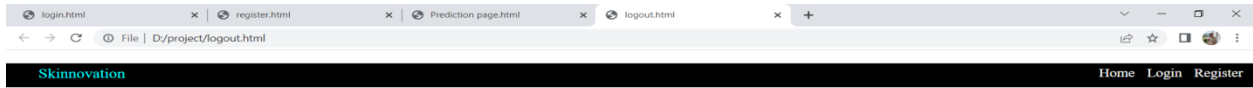

Skinnovation-AI-Based localization and classification of skindiseases with erythema

Nowadays people are suffering from skin diseases. More than 1.55 million people suffering from Psoriasis skin cancer rate is rapidly increasing over the last few decades especially Melanoma is most diversifying skin cancer. If skin diseases are not treated at an earlier stage then it may lead to complications in the body including spreading of the infection from one individual to the other. This skin disease can be prevented by inspecting the infected region with an early stage. The characteristic of the skin images is diversified so that it is a challenging job to device an efficient and robust algorithm for automatic detection of skin diseases and its severity. Skin tone and skin colour play an important role in skin diseases detection. Color and coarseness of skin are visually different. Automatic processing of such images for skin analysis requires quantitative discrimination to differentiate the disease.
